

Tourniquet cuff application guide

A cuff should be applied comfortably and two fingers should easily fit under the distal and proximal sides. If only one finger fits the cuff is too tight; if three fingers fit it is too loose.

A TIGHT cuff may affect the return venous blood flow from the limb even if deflated. It can also cause marking & impede inflation

A LOOSE cuff will require higher pressure to stop the blood flow and could allow the cuff to move to an unsafe area of the limb during the procedure.
